

## 3. Analyses Plan

true

2021-06-23

### Background

In an attempt to incorporate uncertainty to Gächter et al. (2017)’s dynamic public goods game (DPGG), I plan to run a series of remote online experiments using oTree (Chen, Schonger, and Wickens 2016). The first experiment will replicate Gächter et al.’s NOPUNISH 10-period version as close as possible (given the remote circumstances). The current demo version of the experiment can be found here. Click here to visit the corresponding Github repository.

This report is the third in a series of reports covering this project. It reads the data prepared in the previous reports and analyzes them.

### Results

#### First Round

#### Provision of the public good and wealth creation

Table 1:

| Statistic | replication | GMTV      |
|-----------|-------------|-----------|
| Mean      | 764.333     | 478.087   |
| Median    | 774.5       | 304.000   |
| St. Dev.  | 41.790      | 393.575   |
| Max       | 833         | 1,792.000 |
| Min       | 646         | 161.000   |
| N         | 30          | 23        |

The rank sum test yields a p-Value of 0.0001 for the mean **stock** a.k.a *Wealth* during the last period of the game.

#### Inequality

The rank sum test yields a p-Value of 0.0000 for the mean **gini** during the last period of the game.

#### Sample Properties
